Maintenance Instructions

Traditional Door cannot control the environment that the exterior door units are exposed to. Due to this, the doors and/or door systems should be re-coated **as part of regular maintenance**. This should take place very often (approx every 12 months for south/west exposure....every 18-24 months for north/east exposure) in order for the door system to last a lifetime.

The recommended product to use for this re-coating procedure is Minwax Helmsman Spar Urethane. This product can be found at retailers such as Home Depot and Sherwin-Williams. Please note that this product may slightly change the colour of the stain. Hence, it is recommended that only one coat is applied to lesson any possible colour change.

Application DOs:

- Apply when surface and air temperature is 10C/50F to 35C/95F.
- Apply in direction of the grain.
- Use a long-haired natural bristle brush and maintain a wet edge.

Application DON'Ts:

- Apply when direct sunlight is exposed to the door.
- Apply when surface is hot to the touch (more than 35C/95F).
- Apply for at least 48 hours following any precipitation activity.
- Apply when dew or frost are present.
